

First Grade Geography: Rivers And Lakes Of The World: 1st Grade (Ecology Of Lakes Ponds)

Water is the lifeblood of our planet, and rivers and lakes are two of its most important sources. They provide water for drinking, irrigation, transportation, and recreation. They also support diverse ecosystems and play a vital role in the global water cycle.

Rivers

Rivers are natural waterways that flow from higher elevations to lower elevations. They are formed by precipitation, which seeps into the ground and then flows underground until it reaches a point where it emerges as a spring or seep. Rivers then flow downhill, carrying water and sediment with them.

Rivers are important for a number of reasons. They provide water for drinking, irrigation, and transportation. They also support diverse ecosystems, including fish, plants, and animals. Rivers are also important for recreation, such as fishing, boating, and swimming.
